

PRIVATE DEFI & CAPITAL MARKETS · CANTON FOUNDATION

blackrocq

Confidential DeFi on Canton.

Private send. Private swap. Private limit orders.

 // what the market is allowed to see

THE PROBLEM

On a public chain, everyone sees everything you do.

Every transfer, every swap, every resting order is public the instant you make it. Your positions leak, your orders get **front-run**, your strategy gets copied.

On a public DEX, posting an order is broadcasting your intent to every bot in the mempool. That is not a bug in one app. It is how public ledgers work.

PUBLIC MEMPOOL: YOUR ORDER IS VISIBLE

you post: buy 1 wBTC 65,000

bot front-runs you 65,180

your fill (sandwiched) 65,420

MEV extracted from you ~ \$420 / wBTC

Three things you can't keep private.

TRANSFERS

Every send is a public trail.

Balances, counterparties, and timing are exposed forever. Anyone can map who paid whom, and how much.

SWAPS

Front-run before they land.

A swap sits in the public mempool. Bots sandwich it, taking the spread and handing you a worse price.

ORDERS

A resting order is a signal.

Post a limit order and the whole market sees your size and price. They trade against you before you fill.

On public chains, privacy is not a missing feature. It is **impossible**. That is the gap.

Three private primitives, one engine.

01 · SEND

Private transfer

Move tokens to anyone with no public trail. Only you and the recipient (and an optional regulator) ever see it.

// Holding.Transfer

02 · SWAP

Private atomic swap

Exchange two assets in a single transaction, or neither leg moves. No mempool, no front-running, no settlement risk.

// Order.Fill

03 · LIMIT ORDER

Private resting order

Post your price; it rests invisibly until your chosen taker fills it. A swap is just a limit order filled at once.

// Order (resting) -> Fill

One ledger. Three points of view.

COUNTERPARTIES

Alice ⇄ Bob

swap 0.5 wBTC ⇄ 32,500 USDC · limit order: 1 wBTC for 66,000 USDC ·

✓ LIVE

PUBLIC MARKET

any outsider

No record. Sends, swaps, and orders are settling. It sees none of them.

REGULATOR

read-only oversight

swap 0.5 wBTC ⇄ 32,500 USDC · limit order: 1 wBTC for 66,000 USDC ·

✓ AUDIT

This is the running app, not a mockup. Our test suite **asserts on-ledger** that the public market can query none of it, while the regulator can audit every send, swap, and order.

Two capabilities. Both load-bearing.

CAPABILITY 01

Sub-transaction privacy

Through the signatory / observer model, an outsider never learns a send, swap, or order happened. Confidentiality is a property of the ledger, not a feature bolted on top.

```
// market.query(Order) → ∅
```

CAPABILITY 02

Atomic multi-party settlement

A swap moves both legs together or not at all. There is no public mempool window to front-run, and no intermediary ever holds both sides.

```
// Fill: asset≠asset in one tx, or neither
```

Take either away and confidential DeFi collapses. **That is the test of a real Canton app.**

WHO IT'S FOR

Built for everyone the public mempool exposes.

TRADERS & FUNDS

Move and trade size without being front-run or copied. Your positions and intent stay yours.

MARKET MAKERS

Post private quotes and fill them, without revealing your book to the whole market.

INSTITUTIONS & REGULATORS

Confidentiality the market cannot see, with oversight the regulator always can.

PRIVATE DEFI & CAPITAL MARKETS

PAYMENTS & NEOBANKING

RWA & TOKENIZED DEPOSITS

THE ASK

blackrocq

The front door to private DeFi on Canton.

Send, swap, and trade, without the whole world watching.
